Installing Nethunter in Termux

Installing Nethunter in Termux is very easiy you can visit kali official website to install nethunter in termux. But remember don’t download termux app form play store that the old version. Instead of playstore you can download termux form upto down app store or Fdriod etc.

Here is the official link of kali website where guide is present however , I also use the same process.
https://www.kali.org/docs/nethunter/nethunter-rootless/

```
termux-setup-storage
pkg install wget
wget -O install-nethunter-termux https://offs.ec/2MceZWr
chmod +x install-nethunter-termux
./install-nethunter-termux
```

Just copy paste these command step by step in your termux app.

Important Note:

First of all it show you three version of Nethunter

- **Full**
- **Mini**
- **Nano**

Whatever you want you can choose that version of nethuner. If you have slow internet then it take more time. But the important part is at end you will see something sha url not found etc like this don’t confuse and never quit just want and it might ask you to delete the existing file of nethuner type n for that and continue. After few minutes you when everything is finished type **nethunter** in your terminal it will show you kali@kali.

Congratulation you install nethunter in you Termux app.
